Fabric Test: Change One Thing, Measure One Result

Tracking #: 2026-11-14-EMM-SCI-ABSORB-47

FICTIONAL trial data; no real cloth or water experiment is required

Fabric	Trial 1	Trial 2	Trial 3
Cotton	12 mL	14 mL	13 mL
Microfiber	16 mL	17 mL	18 mL
Same in both	Square size	Water offered	Wait time

1. Fill a labeled four-box fair-test planner: changed variable, measured outcome with unit, TWO controlled conditions, and why those controls matter.

2. Compute the cotton mean using all THREE trials. Show every addition and the division by three. Check that your answer is in mL.

Fabric Test: Change One Thing, Measure One Result

Tracking #: 2026-11-14-EMM-SCI-ABSORB-47

FICTIONAL trial data; no real cloth or water experiment is required

Fabric	Trial 1	Trial 2	Trial 3
Cotton	12 mL	14 mL	13 mL
Microfiber	16 mL	17 mL	18 mL
Same in both	Square size	Water offered	Wait time

3. Compute the microfiber mean and subtract the cotton mean to find the difference. Show the calculations and units.

4. A friend calls ’the 18 mL trial’ the independent variable. Explain what is wrong and name BOTH the correct changed variable and measured outcome.

Fabric Test: Change One Thing, Measure One Result

Tracking #: 2026-11-14-EMM-SCI-ABSORB-47

FICTIONAL trial data; no real cloth or water experiment is required

Fabric	Trial 1	Trial 2	Trial 3
Cotton	12 mL	14 mL	13 mL
Microfiber	16 mL	17 mL	18 mL
Same in both	Square size	Water offered	Wait time

5. Design a second FAIR practice: name one thing you might change, THREE things to keep fixed, one exact measurement step and a safe way to record results.

6. Write a five-sentence evidence report with the two means, the difference, ONE fair-test control and ONE limit about predicting real fabrics from imagined data.
